Dear NICT Team,

I am IT support guy. It is necessary to periodical change password.

Mosts of common people save a password in a browser and they do not understand its advantage and disadvantage(risk). And they forget they saved a password in a browser. This is usual. People know tech thing far less than we expect.

In such as realistic condition. keeping password permanently is too risky than a reasonable theory. People drop their PC with saved password. This is easily happen in a common people.

I think, the reality sometimes requires redundancy and inefficiency. So conclusion, password needs to change periodically.

*This e-mail is a comment for this entry "06. Shall not require users to change passwords periodically."
