| Comment # | (Base, 63A, 63B, 63C) | Section | Page # | Line # | (Include rationale for comment) | Suggested Change |
| | | | | | | Replace "SHALL" by "SHOULD" for resource constrained hardware-based authenticators when secure element is involved |
| | | | | | | in authentication. |
| | | | | | | Rationale 1: different formats will lead to have 10 commonly used activation values per format. this will not be possible |
| | | | | | | for alphanumeric format. |
| | | | | | The authenticator SHALL contain a blocklist (either specified by specific values or by an algorithm) of | Rationale 2: activation secrets may be generated by systems randomly without blocklist restrictions which would create |
| 3 | 63B | 5.2.11 | 38 | | at least 10 commonly used activation values and SHALL prevent their use as activation secrets | interoperability issues |
| | | | | | The authenticator or verifier SHALL implement a retry-limiting mechanism that effectively limits the number | Could you clarify that the rate limiting mechanism in line 1498 is the retry-limiting mechanism described in the 1494 |
| 4 | 63B | 5.2.11 | 38 | 1494 | of consecutive failed activation attempts using the authenticator to ten (10). | requirement? |
| | | 5.2.11 | 39 | 1498 | In all other cases, rate limiting SHALL be implemented in the authenticator. | |
| | | | | | | Proposed change to allow additional attempts with throttling mechanism without a different authenticator to avoid a |
| | | | | | | permanent lock out. |
| | | | | | | A waiting time mechanism (similar as described in 5.2.2, second bullet) could be configured in order to allow a |
| | | | | | | maximum number of attempts in a given time period. |
| | | | | | | For instance 100 attempts per year after the 10 attempts. |
| | | | | | | Proposal: "Once the limit of "A" attempts is reached, either the authenticator SHALL be disabled and a different role |
| | | | | | | SHALL be required for authentication or a waiting time mechanism is activated in order to limit the number of attemps |
| | | | | | Once the limit of 10 attempts is reached, the authenticator SHALL be disabled | to X per Y unit of time". The values X and Y would be application specific or defined by the SP800-63. |
| 6 | 63B | 5.2.11 | 39 | 1499 | and a different authenticator SHALL be required for authentication | |
