Comment #	Section	Page #	Line #	Comment (Include rationale for comment)	Suggested Change
1	1, 2.2.1, A.3			The allowance of cross security domain authentication is not explicitly stated to be supported. There are mentions of it in section 1, 2.2.1, and A.3, but there is no <i>normative</i> section that addresses that capability. It may be said that SP 800-157 addresses it, but it also only has mentions of this capability and references this document. There appears to be an <i>informative</i> circle of documentation that does not explicitly address the how.	Add language to a <i>normative</i> section that states that derived PIV credentials, both PKI-based and non-PKI-based, may be used for cross security domain authentication.
