

# Challenges and Opportunities in Face Recognition

Presented by: Brendan F. Klare, Ph.D.  
03 April 2025

## Summary of Face Recognition Progress

**Last IFPC, we discussed  
the continued  
exponential reductions in  
error rates**

Are these still occurring?

## Top 10 Algorithms older than 3 years:

## Vendor Error Rate Reduction Over Time

2017-2022: Exponential error rate reduction

2023 to now: linear reduction in error rate

## Challenges

# Is progress is slowing down, or are certain datasets getting “solved” in constrained use-cases?

### What are these remaining errors in the mugshot dataset?

Identical twins? Quality issues? Ground truth errors? Confounding doppelgangers?

How consistently are these top 10 algorithms all getting the wrong answer on the same comparisons?

If all these extremely accurate algorithms are wrong on the same comparisons, are they wrong, or are us humans wrong? 🤔

Top 10 Lowest  
Error Rates on

## Challenges

# Perhaps issue is 1:1 FR benchmarks need to measure FNMR at lower FMRs?

FRVT 1:N shows continued error rate reductions for watchlist identification across large mugshot datasets

This suggests that  $1e-6$ , and especially  $1e-5$ , may no longer be ideal summary statistic thresholds for FMR in 1:1 benchmark

Instead, Face Recognition 1:1 needs to start looking  $FMR=1e-7$  and  $1e-8$  thresholds (though, large data burden to do so)

1:N analysis is always important, but IMO nothing is more important than 1:1 FMR vs. FNMR tradeoff analysis; **1:1 performance can generalize to nearly every use-case**

## Error rates from FRVT 1:N Top 10 Mugshot algorithms: *Significantly more variance than 1:1!*

Error rates are False Negative Identification Rate (FNIR) at False Positive Identification Rate (FPIR) to 0.003

## Challenges

# Cases where quality issues cause errors

If all top performing algorithms fail on the same sample due to quality issues, can we expect these cases to ever be “solved”?

Operationally, best you can hope for is to flag as low quality and reject in many cases. Should we remove these samples from benchmarks, or give vendors credit for flagging them instead?

It is unclear what errors currently remain in NIST benchmarks that are getting saturated.

Maybe there could be a “qualitative analysis” FRTE document that analyzes remaining error cases in constrained test sets and shares the findings with vendor community?

## Challenges

# Massive progress is still being made on highly unconstrained use-cases

Frontal to profile matching is now quite accurate! ~95% Rank-1 accuracy on 1.6M database for several algorithms. (Of course, mugshot frontal to profile is constrained use-case.)

***Incorporating NIST FIVE as a new FRTE test set in the ongoing benchmarks would be critically impactful***

We are almost certainly still in the midst of exponential error rate reduction on highly unconstrained data and now more than ever need ongoing benchmarks that capture this use-case

Only two vendors in the top 10 for every benchmark

One of these two is listed 5th overall on the 1:1 online leaderboard, even they are #2 overall in mean error rate

This is because the table default sorts by Visa-Border error rate

## Challenges

# What test sets are the most important?

Seven Total Datasets are Currently Listed in FRTE 1:1 Online Leaderboard:

Gallery	<a href="#">MUGSHOT</a>	<a href="#">MUGSHOT</a>	<a href="#">VISA</a>	<a href="#">VISA Yaw≥45</a>	<a href="#">BORDER</a>	BORDER
Probe	<a href="#">MUGSHOT</a>	<a href="#">MUGSHOT ΔT≥12 YRS</a>	<a href="#">BORDER</a>	<a href="#">BORDER*</a>	<a href="#">BORDER</a>	KIOSK

FRTE online leaderboard defaults to sort by “Visa Border” error rate; is this the most important dataset?

Or, are all seven listed datasets equally important?

***What about sorting based on mean error rate across all test sets?***

Most people seem to take the default ordering on the site as the defacto ranking, even though it is sorted based on error rate for one of the seven test sets listed

## Challenges

# Who is the most accurate vendor for Identity Proofing / Mobile Identity Verification?

No one knows! 😊

Use-case involves comparing selfie face photo to drivers license, passport or other ID card through a mobile app.

Despite being a massive use-case across banking and enterprise ID verification, there is no ongoing benchmark measuring what vendor is most accurate.

Perhaps Visa Border approximates to this use case?

The IRS and other USG agencies are deploying this use-case, perhaps they can feed FRTE team some data?

## Mobile Identity Verification

**Are DeepFakes the biggest  
threat to facial verification  
use cases?**

**No**

## Mobile Identity Verification

# Injection Attacks are the biggest threat.

Both DeepFakes and - **much worse** - **authentic face images acquired from the public domain**, can be presented to an Identity Verification system via sensor bypass (e.g., virtual camera)

## Opportunities

# What have we discussed so far?

Certain FRTE benchmarks have saturated

Need to measure FNMR at lower FMR rates

Lack of ongoing benchmarks for rapidly progressing use-cases (Mobile IDV, Unconstrained) is a challenge

**Face recognition algorithms have gotten extremely accurate!!!**

Qualitative analysis of errors more important than ever

Opportunity

# What are the implications of these factors?

## Opportunities

# Amazing time for agencies managing identity systems!

Dozens of face recognition algorithm providers are offering elite, top-tier performance solutions

Critical procurement factors other than accuracy can now be emphasized:

- Cost
- Customer support
- Hardware requirements
- Scalability
- Trustworthiness

## Opportunities

# Face recognition solution providers have a lot more work to

Keep delivering exponential improvements to unconstrained face recognition

Focus on accuracy improvements for constrained use case at very low FMR's ( $1e-7$  and lower)

Solve edge-case problems and broader facial analytics problems (injection attack, age estimation, etc).

Are FR algos solving identical twins, or is this going to be handled via metadata (hint: metadata works, algos may never)

# Questions
